

Bone Marrow Transplantation for MDS

Manuel R. Espinoza Gutarra M.D.

Assistant Professor

O'Neal Comprehensive Cancer Center at UAB

Disclosures

- Research Support: BMS Foundation
- Consulting and Advisory: IQVIA, Aptitude Health, AAMDSIF, NMDP

What will this presentation cover?

- Which MDS patients need or can receive a transplant?
- How do you prepare for a transplant?
- What happens during the transplant?
- What happens after the transplant?
- Side effects
- Conclusion

UAB THE UNIVERSITY OF
ALABAMA AT BIRMINGHAM.

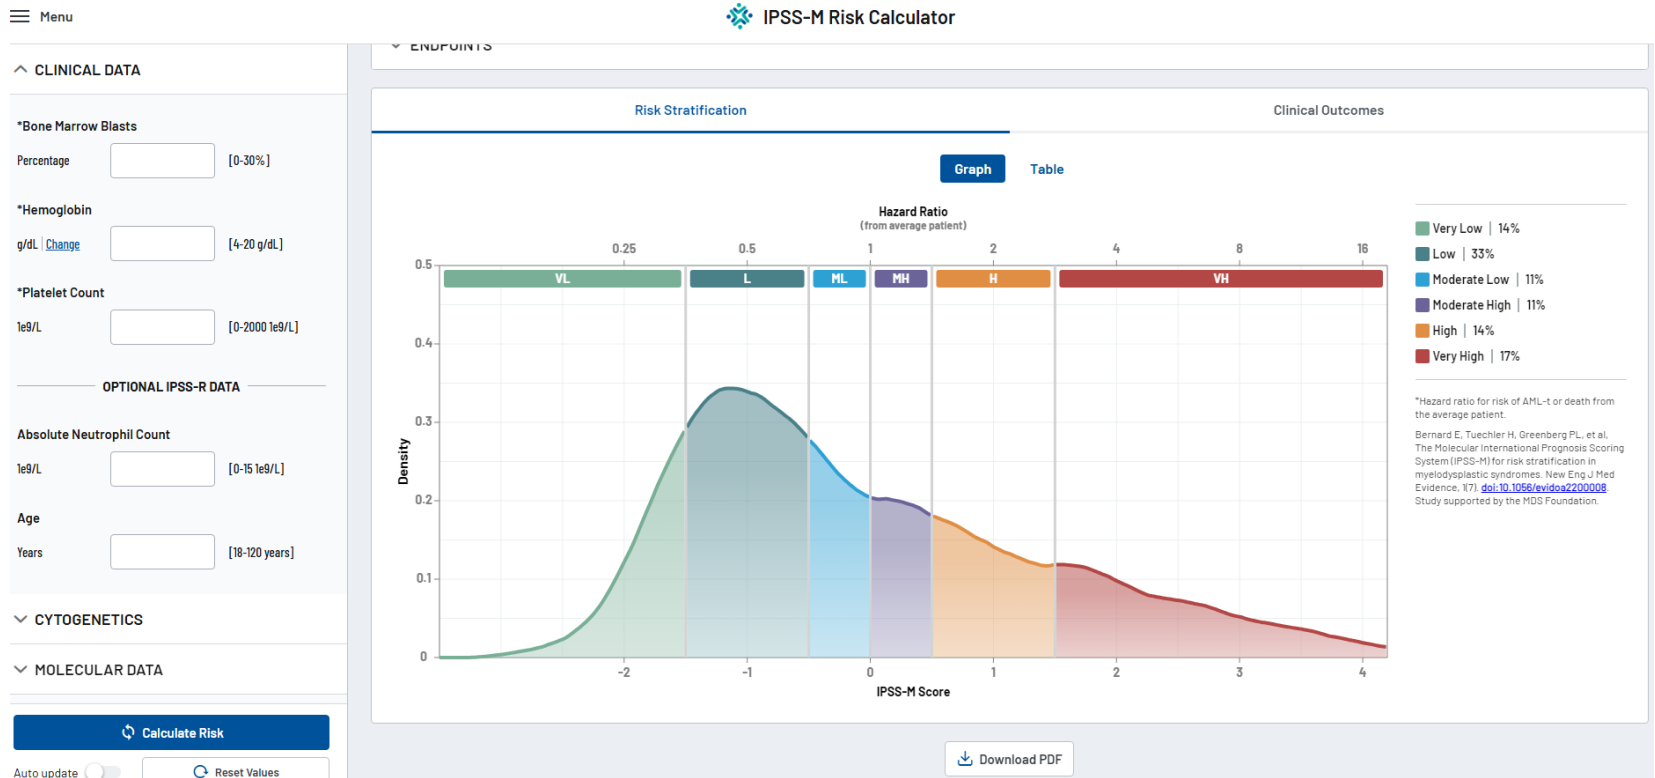

O'Neal Comprehensive Cancer Center at UAB

Who needs a transplant?

Clarification

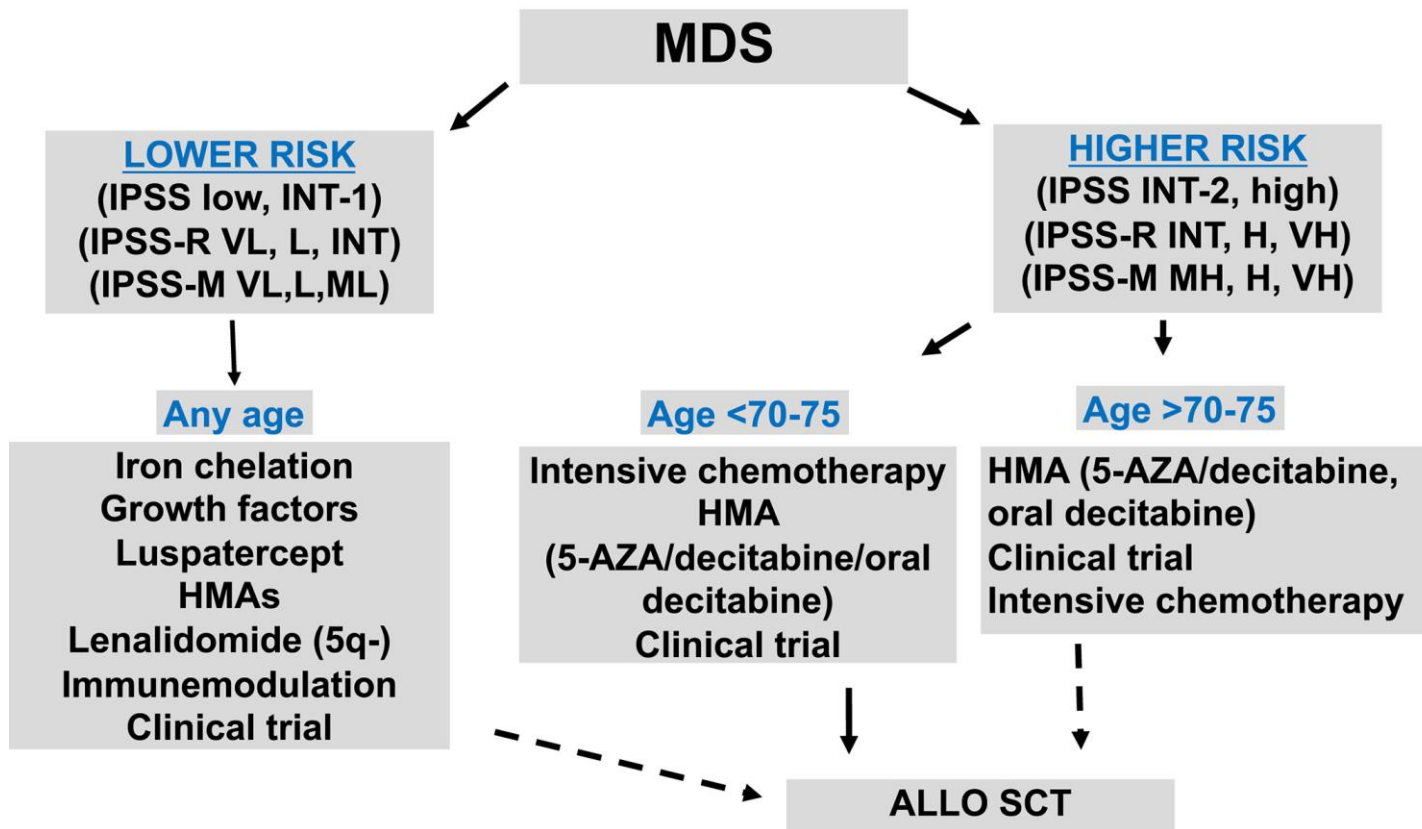

- Bone Marrow Transplant = Stem Cell Transplant
- For MDS we use exclusively “allogeneic” transplants
 - Cells are given from donor – as opposed to our own

MDS Risk Stratification

MDS Treatment

Proposed treatment algorithm for patients with MDS 2023

Garcia-Manero et al. Am J Hematol. Jun 2023

Why do we recommend transplant?

Nakamura et al. JCO 2021

Conclusion

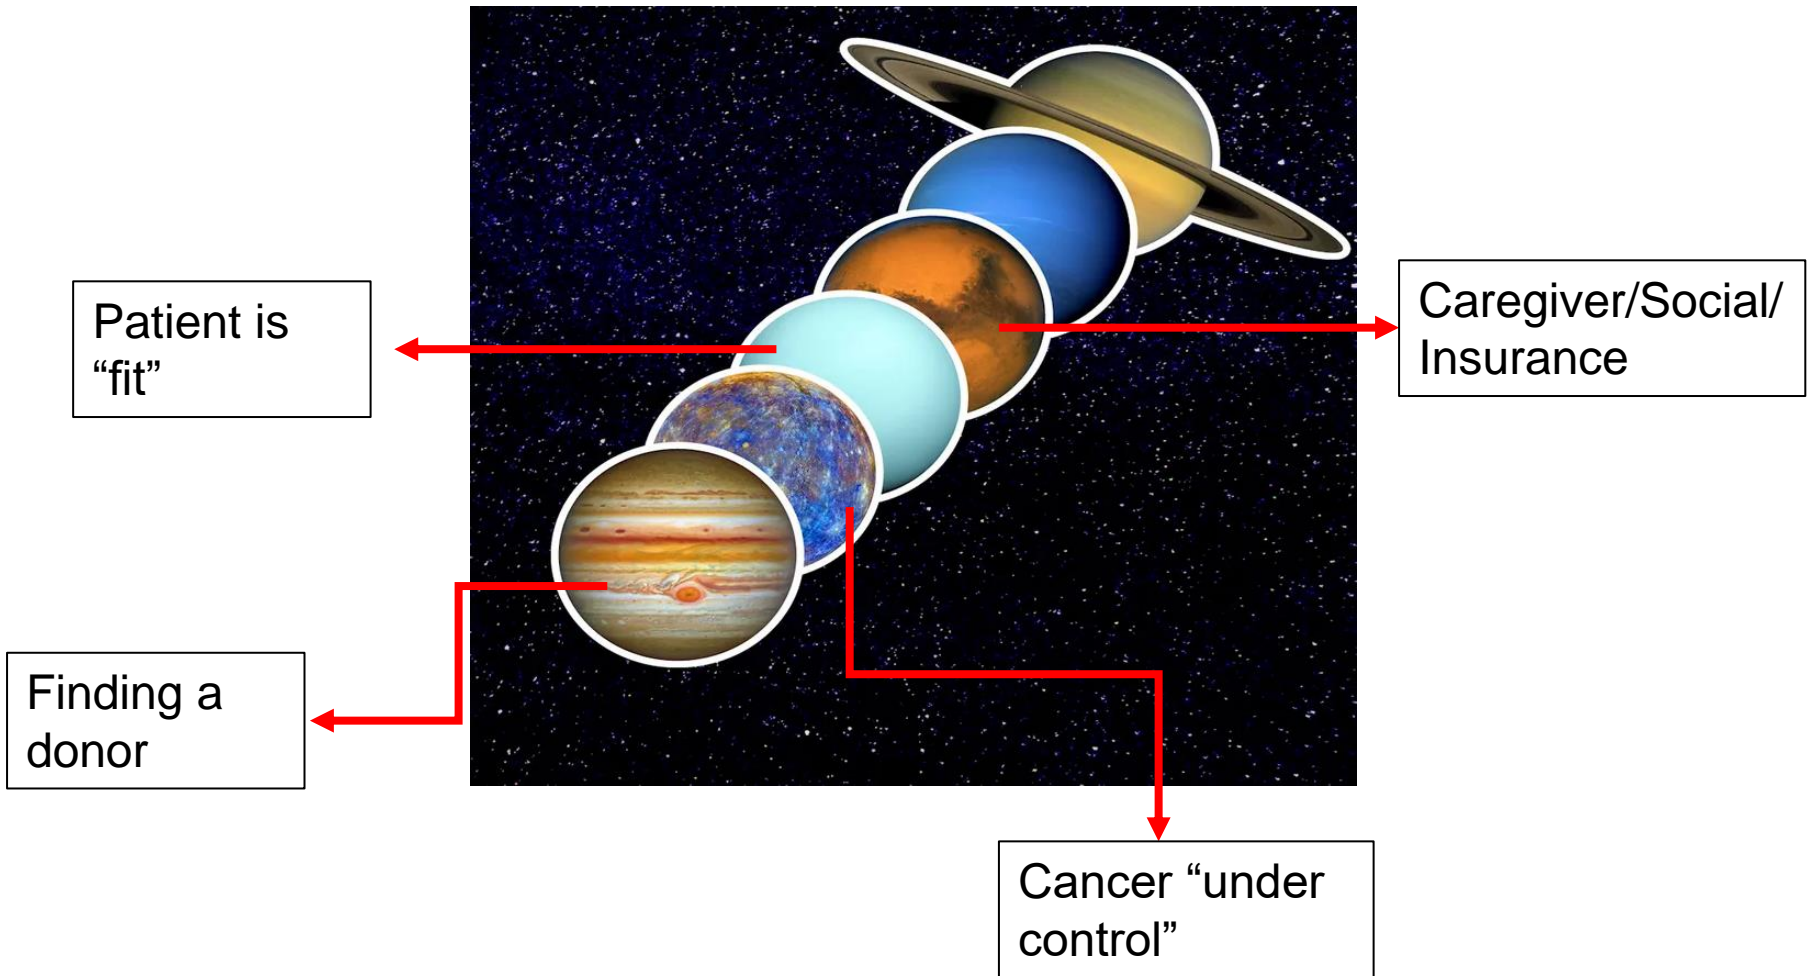

- High Risk MDS
- Low Risk MDS – who do not respond to treatment or progress
 - “You have to be a candidate”
 - Goal is to cure

UAB THE UNIVERSITY OF
ALABAMA AT BIRMINGHAM.

The Pre- Transplant Process

Planets Aligning

Donor Search

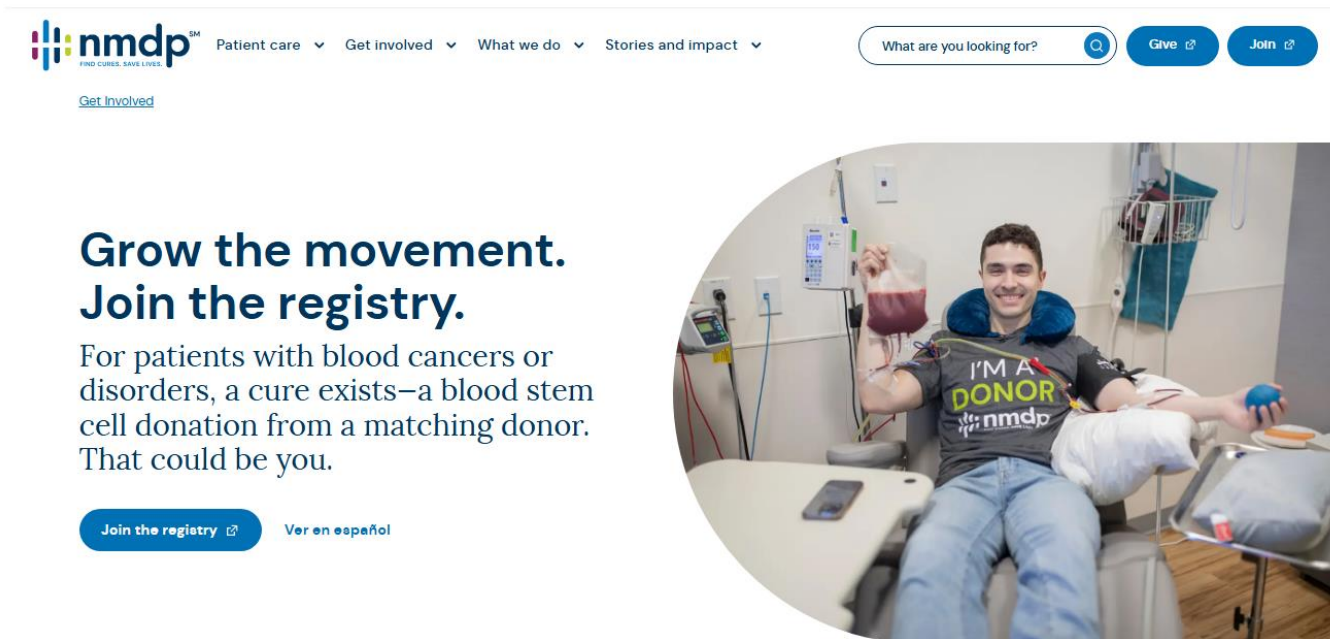

- From Patient: blood draw and cheek swab
- Duration: 2-6 months
 - Ethnic minorities
 - Amount of 1st degree relatives
- We search through: Bone Marrow Donor Registry (NMDP) and test 1st degree relatives.
- Use of “half matches” or cord blood have increased donor pool
- In the current year, almost all patients that need and want a transplant can find a donor.
- Agreeing to a donor search does not equal agreeing to transplantation

Sign up for the NMDP donor registry

<https://www.nmdp.org/get-involved/join-the-registry>

**Grow the movement.
Join the registry.**

For patients with blood cancers or disorders, a cure exists—a blood stem cell donation from a matching donor. That could be you.

[Join the registry](#) [Ver en español](#)

Patients depend on each of us

Patients who need a life-saving blood stem cell transplant often don't have a matching donor in their family. That's when they turn to NMDPSM. We connect them to potential donors like you—and have been doing so since 1987.

Donation Process

- Minimal to no risk for donor
- In adults, almost always use peripheral blood stem cells
 - Similar to plasma donation
- If you are determined to be a match (for family member or registry patient)

Step 1: Physical Exam and Questionnaire

Step 2: Stem Cell Mobilization

- 4-5 injections, once a day prior to donation
- Occasional mild body aches

Step 3: Stem Cell Apheresis

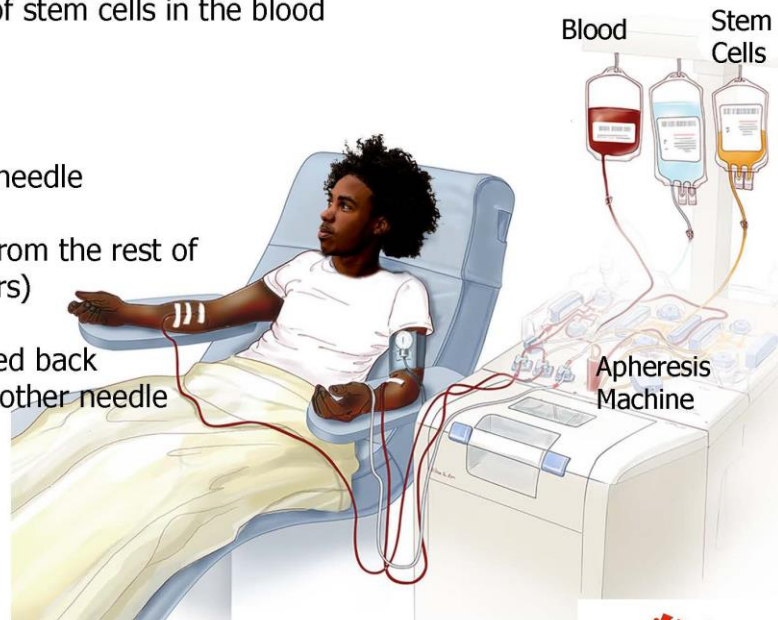

Stem Cell Donation from Blood

Prior to Donation

The donor receives daily doses of a growth factor, starting one week prior to donation
This increases the amount of stem cells in the blood

Day of Donation

- 1 Blood is drawn through a needle
- 2 Stem cells are separated from the rest of your blood (takes 4-6 hours)
- 3 Remaining blood is returned back into your body through another needle

Disease Under Control

- Achieving a remission is ideal, but not needed in MDS
- Depends on risk stratification and blast%
 - Individualized decision
- Azacitidine, Decitabine, venetoclax or other as decided with your treating physician.

Patient is “fit”

- Fitness is relative and age dependent
- The following tests will be repeated prior to your transplant
 - Heart ultrasound / Cardiac stress test
 - Spirometry (lung test)
 - Blood tests to evaluate kidney and liver function
 - CT scans
 - Additional testing depending on your symptoms and pre-existing conditions.
 - You might be required to see additional specialists (heart, lung, kidney, infection doctors) depending on what your tests show

Social Context

- Caregiver: Patients need a dedicated –full time – caregiver for at least 1 year after transplant
- Insurance: Most insurances (including Medicaid and Medicare) cover bone marrow transplant
 - But patient MUST be insured
- Social: Patients should be able to come to and from frequent appointments and adhere to medications
- Patients should NOT drink alcohol heavily, smoke/chew tobacco or partake in illegal/recreational drugs.

Transplant is a Team Sport!

The Actual Transplant

Final Pre-Transplant Procedures

- Bone Marrow Biopsy: Most patients will have 1 repeat bone marrow biopsy prior to transplantation
 - To confirm disease is under control
- “Final” Appointment
 - You will sign consents agreeing to proceed
 - Doctor, Pharmacist and Nurse will go over details
 - You will be given a calendar

Patient: Dr. Seuss

High Dose Chemotherapy

- Kills remaining cancer cells and your old “normal” cells
- Makes “space” for upcoming donor cells
- Also known as conditioning regimen

Transplant Day – Donor cells are infused

- Glorified blood transfusion
- Might experience some chills and nausea
- Smells funny
- Known as Day 0

Anti-Rejection (GVHD) Medications

- Started either before or after cells depending on specific patient
- Lower immunity for several months to years after transplant
- Are **crucial**
- Require therapeutic drug monitoring as outpatient
- Are “not forever”

Continued inpatient care

- Daily evaluation and labs
- Transfusions, antibiotics and other supportive care as needed
- On average 30 days of inpatient stay
- Discharged after donor cells “come online”

UAB THE UNIVERSITY OF
ALABAMA AT BIRMINGHAM.

O'Neal Comprehensive Cancer Center at UAB

Post-Transplant Care

Continued outpatient care

- Twice a week until day 60-100
- Specialized labs, transfusions and IV meds as needed
- Out-of-town patients relocate to Bham at least until day 100
- Visits space out over time
- You will take **lots** of pills
- Bone marrow biopsies will be repeated at day 100 and day 365 at the minimum
- On average patients need 1 year to recover

Long Term Follow-up

- Organ testing will be repeated even if you don't have symptoms – detect toxicity early
 - Heart, lungs, bone density, hormones, etc
- Patients usually considered “cured” after 5 years
- You will always need to follow up with transplant clinic
 - Over time might just be once a year
- You are slightly more susceptible to “normal diseases” and should work to prevent them
 - Heart attacks
 - Stroke
 - Diabetes
 - Other cancers: breast, colon, prostate, etc
 - Infections: influenza, covid, etc

ALABAMA AT BIRMINGHAM.

O'Neal Comprehensive Cancer Center at UAB

Side Effects

THE GOOD THE BAD AND THE UGLY

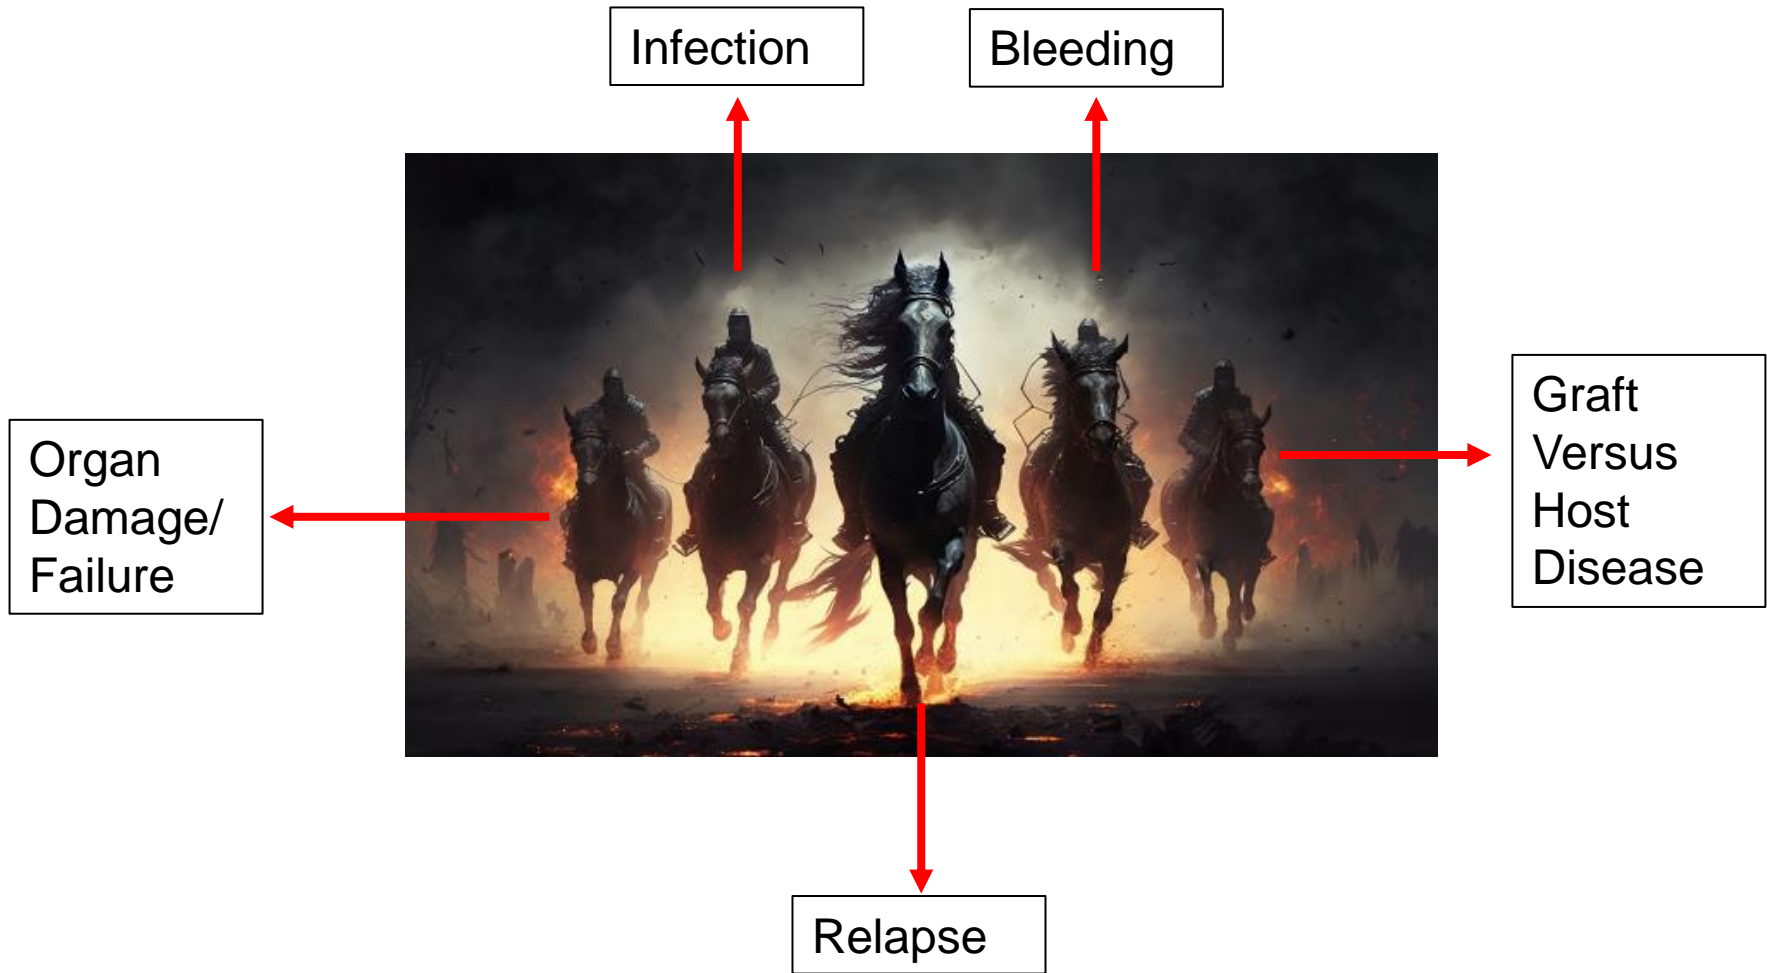

The Ugly – Non-Lethal Side Effects

- Nausea/Vomiting/Diarrhea
- Fatigue
- Weight Loss/ low appetite
- Hair loss
- Mucosal ulcers
- Pain
- Loss of fertility/libido
- Anxiety/Depression

- Most are transient, but can take up to 1 year to resolve
- Treated supportively

The Bad – Potentially Lethal

- Infection
 - You will be on preventative antibiotic, antivirals and antifungals
 - Risk is greater in the first 100 days, but remains higher than a “normal” person
- Bleeding
 - Related to low platelets early after transplant
 - Will need transfusions early on
 - Can be lethal if massive/internal
- Organ Damage/Failure
 - Due to high dose chemo, other medications, infection or GVHD
 - Any organ can be affected: heart, lung, liver, kidney
- Graft Versus Host Disease
 - Can vary from mild to life threatening inflammation of certain organs: skin, gut, liver, lung
 - Donor Cells attacking “you”
 - Better prevention strategies and treatments available
- Relapse
 - Cure is not guaranteed
 - Risk is higher in the 1st year
 - You might benefit from low dose chemotherapy post transplant based on discussion with your doctor

UAB THE UNIVERSITY OF
ALABAMA AT BIRMINGHAM.

O'Neal Comprehensive Cancer Center at UAB

Conclusion

Why do a bone marrow transplant?

- Decision up to individual patient
- Offers only possibility of cure
 - Other treatments will only keep it at bay
- ~40-50% of patients survive long-term
- We are working to improve every day!

UAB THE UNIVERSITY OF
ALABAMA AT BIRMINGHAM.

Thank you!
